Agents

Network for hosts that run automation and AI agent software.

Permitted devices

Machines that are managed by/host agents. Nothing else shares this zone. Services used by the agents (non-root) are hosted on other networks and accessed over the internet.

Access

Agents can reach the internet, plus name resolution and time sync. They can't reach any internal zone.

Notes

- Everything an agent does goes out through the internet. Nothing it does can start a connection to another zone.

Why it's set up this way

Agent software takes actions on its own and talks to outside services, so it is treated as an untrusted guest. If one misbehaves or gets manipulated, it can't touch personal devices or servers.
